SUPREETH GUNNIGUNTLA VIDYASAGAR

+1 (812) 947-3894 | supreethgvvs@gmail.com | linkedin.com/in/g-v-supreeth-331610217

Data Engineer with a track record of building enterprise-grade pipelines, analytical platforms, and data infrastructure across AWS, Azure, and GCP. Proficient in PySpark, dbt, and Airflow. Proven experience delivering scalable data systems for ESG compliance and financial intelligence at EY.

TECHNICAL SKILLS

Programming: Python, SQL, PL/SQL
Data Engineering: Apache Airflow, Apache Spark, Apache Kafka, dbt, Databricks, PostgreSQL, Snowflake
Data Modeling: Dimensional modeling, Medallion Architecture, ER Diagrams
Cloud Platforms: AWS, GCP, Azure
Data Visualization: Tableau, Power BI, Looker Studio

PROFESSIONAL EXPERIENCE

Data Engineering Intern | Antern Technologies | Bengaluru, India *May 2025 – August 2025*

- Owned end-to-end design of an AWS-native data pipeline (S3 -> Databricks -> dbt -> Redshift -> Power BI), surfacing gender, experience, location, and salary trends to give HR teams their first data-backed view of workforce composition
- Engineered PySpark transformations to normalize inconsistent experience data, resolve multi-valued fields, and extract structured attributes from raw HR records at scale
- Designed a fact-dimension data model using dbt, enabling self-serve analytics and clean separation of reporting logic from raw data
- Automated daily ingestion and incremental loading via Apache Airflow, eliminating manual intervention across the pipeline

Senior Analyst | EY | Bengaluru, India *February 2023 – July 2024*

Joined as intern (Feb 2023), converted to full-time (July 2023)

- Scaled a SaaS ESG platform to enterprise-grade performance by re-engineering 260+ database workflows, eliminating bottlenecks and achieving a 70% throughput improvement under peak load
- Contributed to the design and delivery of 140+ PostgreSQL stored procedures for ESG regulatory reporting, directly strengthening statutory compliance and reducing legal exposure.
- Architected secure analytical dashboards with role-based access controls and query indexing, enabling auditable 5-year trend analysis at 70% faster response times
- Led data architecture for a banking client's enterprise warehouse, consolidating 3 source systems into a unified analytical layer serving 16M+ customers, implementing SCD Type 2 for full historical lineage
- Applied data profiling across 3 source systems to design a clean fact-dimension model from 35+ business reports, resolving inconsistencies and standardizing reporting logic across teams
- Introduced dbt + Apache Airflow into the reporting stack, replacing manual workflows with fully automated, reliable pipeline orchestration
- Architected 43 normalized ER models using Oracle SQL Developer Data Modeler, establishing a scalable schema foundation that served as the team's reference architecture and cut debugging time by 50%

EDUCATION

Indiana University, Bloomington, USA *August 2024 – May 2026*
Master of Science in Data Science
Research Assistant | O'Neill School of Public and Environmental Affairs, IU *Jan 2026 – May 2026*

ACADEMIC PROJECTS

Real-Time Logistics Tracking Pipeline -- Kafka + Spark + Snowflake

- Ingested real-time GPS and delivery status events via Kafka, processed with Spark Structured Streaming to detect delays and route deviations, and landed enriched data into Snowflake via incremental micro-batch writes.
- Implemented watermarking and late-arrival handling in Spark to ensure event-time accuracy, powering operational dashboards for last-mile delivery visibility.

Supply Chain Analytics Platform -- Azure Data Factory + dbt

- Built an Azure-native batch pipeline using ADF for ingestion and orchestration into ADLS Gen2, processing 100K+ supply chain records across Bronze/Silver/Gold medallion layers with dbt handling all transformation logic.
- Delivered Power BI dashboards giving inventory managers visibility into stock levels and reorder triggers, replacing manual reporting across the supply chain.

Financial Intelligence Hub -- LangChain + ChromaDB + Gemini

- Built a multi-tool ReAct agent using LangChain and Gemini Flash covering real-time stock data, technical indicators (MA/RSI), and autonomous trade execution
- Implemented a RAG pipeline using ChromaDB and Google Generative AI embeddings for contextual S&P 500 analysis, deployed via Streamlit with a portfolio dashboard showing live P&L and trade history
